

SWP-206 RF Monitor and Protection Application Note #1- *SWP-206 GUI*

The SWP-206 Graphic User Interface

Application: The *SWP-206 graphical user interface* is intended for SWP-206 chassis equipped with the optional LAN board. This application provides the addition of a graphic user interface. The software was developed for use on Windows XP and Windows 7* Professional or higher running in Virtual XP mode. Important parameters can be viewed using this graphical user interface software available as a free download on our website.

Benefits: View Important parameters such as Forward Power, Reflected-power, Temperature** / Pressure** for up to eight channels including external interlock status on your computer display. A remote fault reset command is also accessible via the GUI. The GUI provides a one page snapshot of a typical master antenna/combiner system. Connectivity via the GUI is made using our optional LAN-100 board which is installed inside the SWP-206 and provides RJ-45 and DB-9 connections which allow for direct connections to your internet router, direct serial connection to a computer, or even a telephone modem via the DB-9 serial connection. This outstanding flexibility allows the GUI option to work even without a high speed Internet connection at the site. For customers who have already purchased an SWP-206 without a LAN-100 board they are available as an upgrade. Contact the factory for details.

How it Works: Simply install the software using the installation instructions provided, and run the software. Configuration is simple. The Options button provides a choice of TCP/IP, SERIAL, or MODEM connections. Once configured simply click the Connect button to connect to your SWP-206 and view the real time parameters of your site.

To download the free graphical user interface click [HERE](#)

*Comparability to Windows 7 may vary and is not guaranteed.

**Additional hardware is required for these features.
